

- Radiation lengths and collisional energy loss calculations 99% done
 - Take numbers from: <https://hallaweb.jlab.org/dvcslog/g2p/172>
 - Min's ELOG post
- Tech-Note is done as well
- One remaining question:
 - What was after the scattering chamber but before the HRS Q1 Entrance?
 - Min's spreadsheet/ELOG post suggests helium gas/helium bag

Did scattered electrons go through helium gas or air?

Also path length from end of scattering chamber to Q1 entrance?

Worried that maybe Min used length to local dump ?
